Final Project (200 points)

Description:
You will be building a small website and writing all the HTML and CSS you need for it. The site must be a minimum of 3 pages all linked together properly. Some layouts and graphics are included with this assignment which you may use as design. The requirements are stated below and we will discuss more in class.

Requirements:
- Build a minimum 3 page site with navigation linking to all pages
- Pages should be home page and 2 interior pages. One being a contact us page.
- The home page and interior page should have a different design.
- Contact us page should have a contact form on it.
- The contact form doesn't need to actually connect to a script on the server
- The interior page can have dummy placeholder text as content.
- Base it on the provided layouts.
- Formatting of content area on interior page is up to you. Just add some headlines, floated image(s), placeholder text

You will probably want to use some type of css reset like we have talked about in class. Maybe even the html5shiv to get ie support.

I have enclosed images and layouts to base your design off of.

HOMEPAGE:
See enclosed homepage image for layout.

Extra credit will be awarded if you use a jQuery JavaScript slideshow for the large header image. If you decide to do the slideshow just create or download a different image to switch between.

CONTACT US PAGE:
Format the content area of the page to look however you like. Please use a HTML form as a contact form. The form does not need to connect to a server script. Just add the form and use css to format it.

Extra credit will be awarded if you use the Google Maps JavaScript API to add a map to the page. This is not the embed html code you find on a google maps page but the actual JavaScript API we will discuss in class.

INTERIOR PAGE:
Us the included layout as a guide. The content area of this page is up to you. Please use some headlines and placeholder text as copy. Also try to float an image or two in the body of the text. You may use an image from the homepage, download any other

image or use one of the uncropped ones in the misc image folder.

You can use this site to generate placeholder text:
http://www.lipsum.com/

The zip folder also contains the layered photoshop files if you have access to photoshop. There is also a web font zip I downloaded from font squirrel to use for the company name, nav and headers.

We will discuss this in class more. If you have any questions email me and I will answer by email or in class.

Submit on blackboard the URL for your index page so I have record of your submission in my grade book when you are ready to be graded.
Due December 9 – 23:59 Chicago Time — No late work accepted. NO ACCEPTIONS
